Summer, sun and version control

Introduction to Git workshop

The WFW community was created to make it easier for women to share their skills and knowledge among their female friends. If you want to deepen your IT knowledge but feel too awkward/shy to ask the opposite gender for help, consider this group to be your starter-kit for the future. AWESOME DAYS are coming ahead!

Let's make learning great again!

Best pastime when it is +27 and Juhannus is just in two days? For some women, it was learning version control and philosophy of DevOps! On 19 June, Women for Women (WfW) together with Eficode organised a second workshop of the spring 2019 season on choosing a career path in IT.

Consultant from Edicode led an interactive workshop that combined brief introduction to Git theory and history, interactive group work exercises supported by WfW mentors, overview of DevOps and an energising networking at the top floor sauna.

Git is a tool used to track changes in the code, similar to tracking changes in Word documents. It is widely used by teams of developers and also allows developers to create own programming portfolios. Git workshop was not only about technical skills and deep understanding of different commands - it was also about productive teamwork and respect for each other's work. Workshop participants got a great walkthrough on best practices of using Git in a real life, and will definitely know how to prevent disasters in their IT careers. What definitely makes WfW workshops special, is a good balance between independent work of participants and help provided by mentors.

Interested in jumping in a world of IT and meeting soulmates during interactive and inspiring workshops? Follow Women for Women workshop in Facebook (https://www.facebook.com/WfWworkshopFinland/) and stay tuned for next events!
